

Environmental Monitoring for Damp & Mould Risk

Identify properties at risk of damp and mould with a single sensor and zero-effort install

Powerful data insights can be crucial, particularly in these times of energy crisis, fuel poverty, increased disrepair cases and housing decarbonization.

Our discreet, efficient and economical COSIE home sensors continuously monitor environmental conditions and deliver reports for any potential heating, ventilation, damp or mould issues.

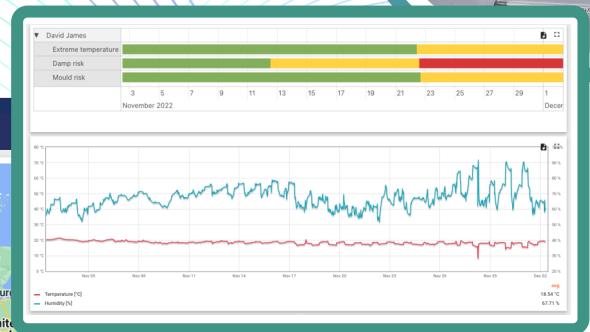

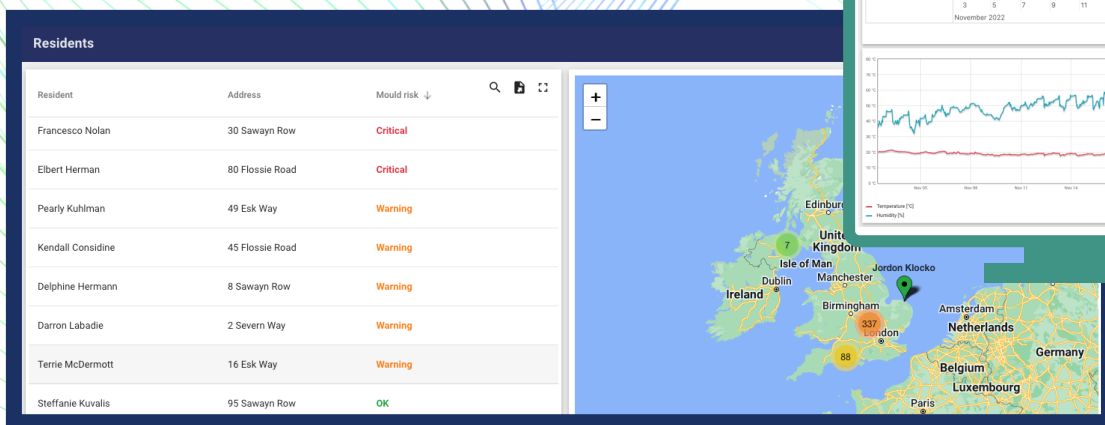

These data insights and alerts are enabling housing providers to:

- Protect the health and wellbeing of residents
- Prevent disrepair through issue identification
- Prioritise remedial actions with weekly risk reports
- Clearly picture a property's condition

What is the Internet of Things (IoT)?

IoT is a system of interconnected devices that pass data and insight, allowing informed decisions to be made. Typical examples include smart thermostats and fitness trackers.

By deploying IoT devices in a variety of situations, organisations can set up smart alerts and triggered actions based on changes in environmental conditions or behaviours.

Low cost solution to maximise limited resources

Zero-effort installation saving time and cost

No internet or Wi-Fi needed for use anywhere in the UK

Battery powered - no energy costs or trailing wires
